

Circulatory System Vocabulary

The Body's Delivery System

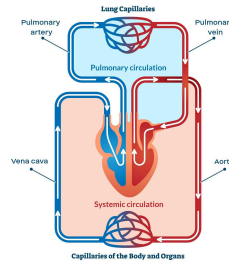

The circulatory system is like a busy highway. It moves blood around your body to deliver the things your cells need to stay alive and carries away the waste they do not need.

Directions: Read the definition for each key term. In the 'Check for Understanding' column, write a short sentence using the word or draw a small icon that shows what the word does in the body.

Term	Definition	Check for Understanding
Heart	A strong muscle that acts like a pump to push blood through your whole body.	
Blood	A red liquid that carries oxygen, nutrients, and waste to and from your cells.	
Arteries	Thick tubes (blood vessels) that carry blood away from the heart to the rest of the body.	
Veins	Blood vessels that carry blood back toward the heart.	

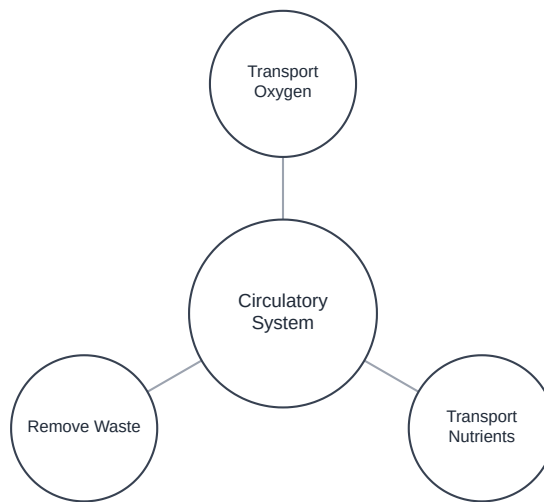

Capillaries	Tiny, thin blood vessels where oxygen and nutrients pass into the cells.	
Oxygen	A gas that we breathe in which cells need to create energy.	
Carbon Dioxide	A waste gas made by the body that we breathe out.	
Nutrients	Substances from food that the body uses to grow and stay healthy.	

Functions of the Circulatory System

The two loops of the circulatory system

Main Functions

1. What is the primary role of the circulatory system in the human body?

- A) To send electrical signals to the brain.
- B) To break down food into smaller pieces.
- C) To act as a transport network for oxygen and nutrients.

2. Why are capillary walls only one cell thick?

- A) To prevent blood from leaking out into the body.
- B) To allow oxygen and nutrients to pass easily into cells.
- C) To help the heart pump blood at a higher pressure.

3. Which waste product is removed from the blood when it travels to the lungs?

- A) Oxygen
- B) Carbon dioxide
- C) Nutrients
